

1. a) BASIS: All propositional atoms p are wffs in L_{\leftrightarrow}
 ii) IND: If A and B are wffs in L_{\leftrightarrow} , then so
 is $A \leftrightarrow B$

iii) CLOSURE: Nothing is a wff of L_{\leftrightarrow} unless it can be
 generated in finitely many steps from i, ii.

b) BASIS: Each atom p is satisfiable. Simply
 take a valuation v with $v(p) = 1$ for all

INDUCTION HYPOTHESIS: Take v s.t. $v(p) = 1$ for all atoms p .

Suppose A and B are any wffs in L_{\leftrightarrow}
 which are both satisfiable by the v
 defined above, i.e. $v(A) = 1$ and $v(B) = 1$.

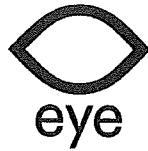

INDUCTIVE STEP: For the v defined above,
 we have $v(A) = 1$ and $v(B) = 1$, so

$v(A \leftrightarrow B) = 1$. Therefore $A \leftrightarrow B$ is satisfiable.

Conclusion: If we define v such that $v(p) = 1$ for all
 atoms p , then $v(A) = 1$ for all wffs in L_{\leftrightarrow} .
 Therefore, all wffs in L_{\leftrightarrow} are satisfiable.

2.	p	q	$(p \wedge q) \rightarrow \neg p$	$(p \vee q) \supset \neg p$
	1	1	1 0 0	1 0 0
	1	i	i 0 0	1 0 0
	1	0	0 0 0	1 0 0
	i	1	i i i	1 i i
	i	i	i i i	i i i
	i	0	0 0 i	i i i
	0	1	0 0 1	1 1 1
	0	i	0 0 1	i 1 1
	0	0	0 0 1	0 1 1

In K_3 , the inference is valid, because for each v with
 $v((p \wedge q) \rightarrow \neg p) = 1$ [there is none], we have $v((p \vee q) \supset \neg p) = 1$

3.

All branches close, so the inference is valid

4. No, the inference is not valid.

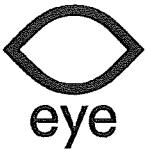

Take, for example, $v(p) = 1$ and $v(q) = 0.5$

Then $v(\underbrace{(p \rightarrow q) \rightarrow q}_{\cdot} \rightarrow q) = 0.5 \leq 0.7$

$$\text{because } v(p \rightarrow q) = 1 - (1 - 0.5) = 0.5$$

$$v((p \rightarrow q) \rightarrow q) = 1 \quad (\text{because } 0.5 \leq 0.5)$$

$$v((p \rightarrow q) \rightarrow q) \rightarrow q = 1 - (1 - 0.5) = 0.5$$

\vdash

etc

\nwarrow becomes an infinite open complete branch

The inference is not valid. From the open branch, we can read off the countermodel $T = \langle W, R, v \rangle$ with

$$W = \{w_i \mid i \in \mathbb{N}\}$$

$$R = \{ \langle w_i, w_j \rangle \mid i, j \in \mathbb{N}, i < j \}$$

$$v_{w_i}(p) = 0 \text{ for all } i \geq 1$$

$$v_{w_0}(p) = 0 / 1 / \text{arbitrary}$$

f. b is complete open branch of a K_{TO} -tableau
 and $I = \langle W, R, v \rangle$ is the interpretation induced
 by b

$$\text{i.e.: } W = \{w_i : i \text{ is on } b\}$$

$$R = \{\langle w_i, w_j \rangle : i, j \text{ is on } b\}$$

$$v_{w_i}(p) = 1 \text{ if } p, i \text{ is on branch}$$

$$v_{w_i}(p) = 0 \text{ if } \neg p, i \text{ is on branch}$$

for arbitrary $w_i, w_j, w_k \in W$,

transitive Suppose $\langle w_i, w_j \rangle \in R$ and $\langle w_j, w_k \rangle \in R$.

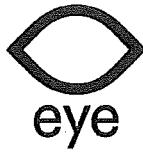

then $i r j$ and $j r k$ appear on b .

because b is a complete open branch of a
 K_{TO} tableau, T has been applied,

so $i r k$ appears on b . Therefore $\langle w_i, w_k \rangle \in R$.

Symmetric Suppose for arbitrary $w_i, w_j \in W$, $\langle w_i, w_j \rangle \in R$.

Because $i r j$ appears on b , and b is
 a complete branch of a K_{TO} tableau,
 σ has been applied. So $j r i$ appears on b .
 Therefore, $\langle w_j, w_i \rangle \in R$

8. $\forall x Q_x \supset \forall x \Box P_x \vdash_{\text{VK}} ? \quad \forall x Q_x \supset \Box \forall x P_x$

$$\begin{aligned} \forall x Q_x &\supset \forall x \Box P_x, 0 \\ \neg (\forall x Q_x \supset \Box \forall x P_x), 0 & \\ \forall x Q_x, 0 & \\ \neg \Box \forall x P_x, 0 & \end{aligned}$$

$$\begin{array}{c} \neg \forall x Q_x, 0 \quad \forall x \Box P_x, 0 \\ \times \qquad \qquad \qquad \Box \neg \forall x P_x, 0 \\ \text{or} \\ \neg \forall x P_x, 1 \end{array}$$

$$\exists x \neg P_x, 1$$

$$\exists a, 1$$

$$\neg P_a, 1$$

$$\neg \exists a, 0 \quad \Box P_a, 0$$

$$\begin{array}{c} \neg \exists a, 0 \quad Q_a, 0 \quad P_a, 1 \\ \uparrow \qquad \qquad \qquad \times \\ \text{complete \& open} \end{array}$$

There are two ^{complete} open branches, so the inference is not valid. We read off a counterexample from the 'middle' branch with a *.

$$I = \langle D, W, R, v \rangle \text{ with}$$

$$W = \{w_0, w_1\}$$

$$D = \{\delta_a\} \quad v(a) = \delta_a$$

$$v_{w_0}(P) = \emptyset$$

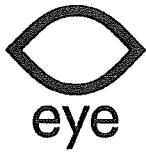

$$v_{w_1}(P) = \emptyset$$

$$v_{w_0}(Q) = \{\delta_a\}$$

$$v_{w_1}(Q) = \emptyset$$

$$v_{w_0}(E) = \emptyset$$

$$v_{w_1}(E) = \{\delta_a\}$$

9.

- a) (i) The empty sequence is a process, because for all definitions in 12 (there are none), f_k is applicable to $\mathcal{Y}_n(\Pi[k])$ in an empty way. (**)
- (ii) (δ_2) is not a process because δ_2 is not applicable to $\mathcal{Y}_n() = \text{Th}(W)$. This is because $\neg K(a) \notin \text{Th}(W)$
- (iii) (δ_3, δ_2) is a process because:
- $P(a) \in \text{Th}(W)$ and $\neg B(a) \notin \text{Th}(W)$, so δ_3 is applicable to $\mathcal{Y}_n() = \text{Th}(W)$
 - $\neg K(a) \in \mathcal{Y}_n(\delta_3) = \text{Th}(W \cup \{\neg B(a)\})$ and $\neg C(a) \notin \mathcal{Y}_n(\delta_3)$ (***)
- (iv) $(\delta_3, \delta_2, \delta_1)$ is not a process, because $\neg \neg C(a) \in \mathcal{Y}_n(\delta_3, \delta_2) = \text{Th}(W \cup \{\neg B(a), C(a)\})$

b)

$$\text{Th}(W) . \emptyset$$

δ_3

$$- \text{Th}(W \cup \{\neg B(a)\}) . \{\neg B(a)\}$$

δ_1

δ_2

$$\begin{aligned} \text{Th}(W \cup \{\neg B(a), \neg \neg C(a)\}) &= \{\neg B(a), \neg \neg C(a)\} \\ \stackrel{\text{closed and}}{=} \text{closed and} \\ \text{successful} &\quad \text{successful} \end{aligned}$$

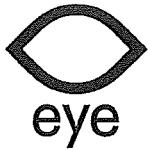

(c) The extensions are $\mathcal{I}_n(\delta_3, \delta_1) =$
 $\text{Th}(W \cup \{\neg B(a), \neg \neg C(a)\}) = \text{Th}(\{P(a), B(a), \neg C(a), \neg K(a),$
 $\forall x (\neg B(x) \vee \neg K(x))\})$

and $\mathcal{I}_n(\delta_3, \delta_2) =$

$$\text{Th}(W \cup \{\neg B(a), C(a)\}) = \text{Th}(\{P(a), B(a), C(a), \neg K(a),$$

 $\forall x (\neg B(x) \vee \neg K(x))\})$

(*) $()$ is not closed (because δ_3 can be applied) but is successful, because $\text{out}() = \emptyset$
 (***) (δ_3, δ_2) is closed because δ_1 is not applicable, see IV. It is successful because $\text{out}((\delta_3, \delta_2)) = \emptyset$

Bonus

No, the statement does not hold.

Take $A = p \wedge \neg p$

$B : q \vee \neg q$

Then $p \wedge \neg p \vdash_{K_3} q \vee \neg q$ and $p \wedge \neg p \vdash_{LP} q \vee \neg q$,

but not $p \wedge \neg p \vdash_{FDE} q \vee \neg q$.

Let's make a tableau.

$p \wedge \neg p, +$
$q \vee \neg q, -$
$p, +$
$\neg p, +$
$q, -$
$\neg q, -$

- The branch is open for FDE, because it does not contain $A,+$ and $A,-$ for any formula. Countermodel:

$p \top_1, p \top_0$, nothing obtains about q

- The branch is closed for K_3 , because it contains both $p,+$ and $\neg p,+$. So the K_3 -tableau is closed, so $p \wedge \neg p \vdash_{K_3} q \vee \neg q$

- The branch is closed for LP , because it contains both $q,-$ and $\neg q,-$. So the LP -tableau is closed, so $p \wedge \neg p \vdash_{LP} q \vee \neg q$
